Back to all questions (/tests/data-science-test/65)

Two bacteria cultures, A and B, were set up in two different dishes, each covering 50% of its dish. Over 20 days, bacteria A's percentage of coverage increased to 70% and bacteria B's percentage of coverage reduced to 40%:

Which of the two bacterium's growth correlates more linearly with the number of days passed?

- A
- B
- O It can not be determined.

Approximately, what is the Pearson correlation coefficient of bacteria B's coverage and the number of days passed?

- $\bigcirc$  1
- 0.2, 0.6]
- $\bigcirc$  0
- O [-0.6, -0.2]
- -1

If, after 20 days, **bacteria A**'s coverage starts to correlate less with its linear trend line, what can we say about the value of its Pearson correlation coefficient?

- O It will stay the same.
- It will decrease.
- O It will increase.
- O It can not be determined.

## Screening Applicants: The Good, the Bad and the Ugly (https://blog.testdome.com/screening-applicants-good-bad-ugly/)

Since we're all biased and we use incorrect proxies, why not just outsource hiring to experts or recruitment agencies? After all, they've been screening people for many years, so they must know how to do it right?

Not really. I was surprised to discover that many experts disagree with each other. Everybody praises their pet method and criticizes the others. Many of these methods look legitimate, but are based on...
